My interest in data science came from a broader curiosity about how software and information systems work. As I explored programming and data analysis, I became particularly interested in how large amounts of data can be processed to identify patterns, support decision making, and solve real world problems. I realized that understanding how data is collected, cleaned, and interpreted is an essential skill in a world where almost every industry depends on digital information. This motivated me to pursue formal training in data science so that I can develop the technical and analytical skills needed to work with complex data systems.

I completed my Secondary School Certificate and Higher Secondary Certificate in Bangladesh, achieving a GPA of 5.00 in both exams. This academic foundation strengthened my abilities in mathematics, logical reasoning, and problem solving, which are essential for further study in computing and data analysis.

After completing HSC, I used my gap year to prepare for university admissions and to strengthen my technical foundation.During this gap year , I achieved an overall band score of 7.0 in the IELTS examination. During this time I also completed the CS50x course offered by Harvard University and the Responsive Web Design certification from FreeCodeCamp. These courses introduced me to core programming concepts such as algorithms, data structures, computational thinking, and problem solving with programming languages like C and Python. I also developed a basic understanding of databases, SQL and how information is structured and retrieved. These experiences helped me understand how software systems process information and strengthened my interest in working with data.

I want to study in New Zealand because of its strong reputation for high quality education and its emphasis on practical learning. Universities in New Zealand focus on developing analytical thinking and real world skills rather than only theoretical knowledge. The country also provides a supportive and multicultural learning environment, which is important for international students like me adapting to a new academic system.

I chose Victoria University of Wellington because its programs emphasize practical skills and research based learning. Studying in Wellington also places students close to government institutions, technology companies, and research centers, which creates opportunities to see how data science is applied in real policy and industry environments. This connection between academic learning and real world applications makes the university particularly attractive for students interested in technology and data driven problem solving.

The Bachelor of Science in Data Science at Victoria University of Wellington stands out because it combines mathematics, statistics, and computer science, which are the core foundations of data science. Courses such as DATA 101 introduce the fundamentals of working with data, including data collection, cleaning, and visualization. Later courses such as DATA 202 focus on techniques like data transformation and web scraping, which are important for gathering and preparing real world datasets. The program also includes machine learning courses such as AIML 231 that introduce statistical modeling and pattern recognition. These subjects are important for developing the ability to analyze complex datasets and build predictive models.

This combination of programming, statistical analysis, and machine learning reflects the key abilities required for a data scientist. Learning these skills through structured courses and practical projects will allow me to build a strong technical foundation for a future career in data science.

Through this program I aim to develop strong analytical and programming skills and gain practical experience. After completing my degree, I plan to build a professional career in data analysis or data science where I can contribute to solving complex problems using data driven methods. I believe that the education and training provided by Victoria University of Wellington will give me the knowledge and experience necessary to achieve this goal.
